- Tubes and Round Shapes

Intelligent Vacuum Gripper

Only one tool for different products - a big advantage!
The UniGripper uses a patented technology that automatically senses the position of the products and creates the necessary vacuum lifting force only where the products are positioned. This means that it is possible to lift several different products quickly and carefully, with only one tool. The result is that the UniGripper improves product handling, while providing a reliable and economic solution without production downtime. UniGripper is adaptable to manual lifting apparatus', gantry robotic systems and industrial robot arms. The grippers are specifically designed according to the customer requirements.
